

Figure 1 is a color image of the field of view of the Wide Field and of Survey Instrument (WFI) of the Hubble Space Telescope. The image shows a large, bright, yellowish-white galaxy (NGC 3690) in the lower-left quadrant, and a cluster of stars in the upper-right quadrant. A red circle marks the position of the primary star in the cluster. The axes are labeled 'Arc Seconds' and range from -30 to 30.
